# Some confusing CSS styles

```
body {
    display: flex;
    justify-content: center;
    align-items: center;
    height: 100vh;
}
```

### display: flex;

#### CSS Flexbox (Flexible Box)

W3Schools offers free online tutorials, references and exercises in all the major languages of the web. Covering popular subjects like HTML, CSS, JavaScript, Python, SQL, Java, and many, many more.

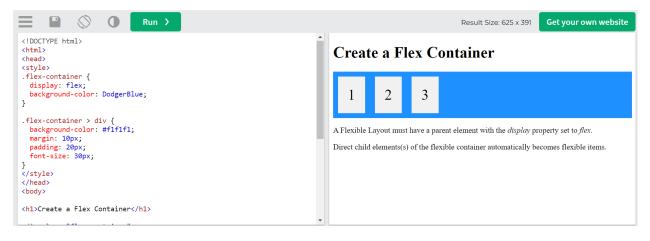

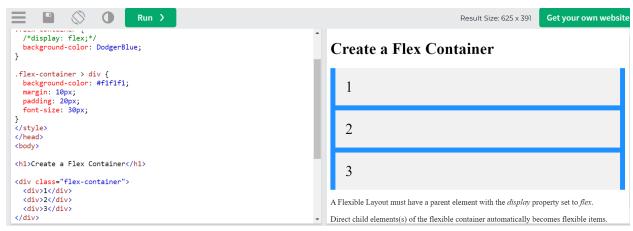

#### Basic concepts of flexbox - CSS: Cascading Style Sheets | MDN

The flexible box layout module, usually referred to as flexbox, was designed as a one-dimensional layout model, and as a method that could offer space distribution between items in an interface and powerful

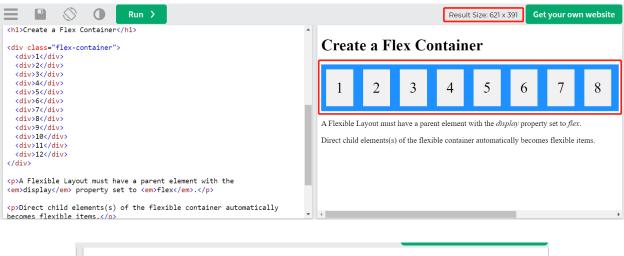

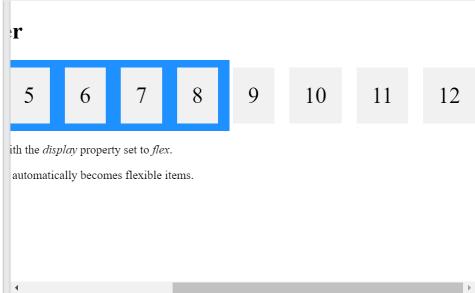

The Flexible Box Layout Module, makes it easier to design flexible responsive layout structure without using float or positioning.

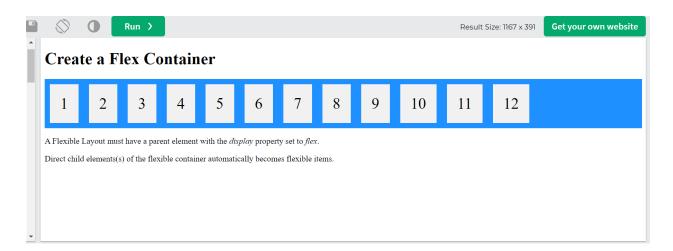

Can be used as a replacement of float.

If add more divs:

any divs outside will not share the blue background.

If increase the size of the window, the blue background will also grow wider as well.

Let's simply named it as a quite flexible display method (based on the width of the window), take all the space.

# justify-content: center;

#### CSS justify-content property

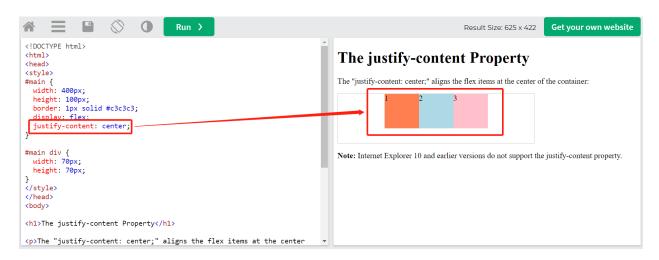

W3Schools offers free online tutorials, references and exercises in all the major languages of the web. Covering popular subjects like HTML, CSS, JavaScript, Python, SQL, Java, and many, many more.

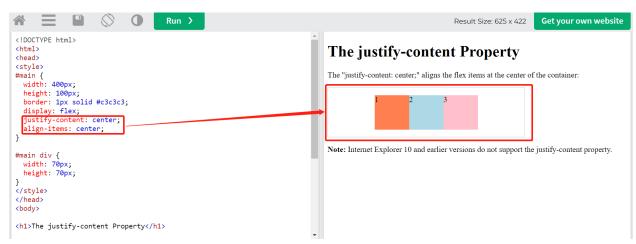

₩ https://www.w3schools.com/cssref/css3\_pr\_justify-content.php

The justify-content property aligns the flexible container's items when the items do not use all available space on the main-axis (horizontally).

**Tip:** Use the <u>align-items</u> property to align the items vertically.

#### justify-content - CSS: Cascading Style Sheets | MDN

The CSS justify-content property defines how the browser distributes space between and around content items along the main-axis of a flex container, and the inline axis of a grid container.

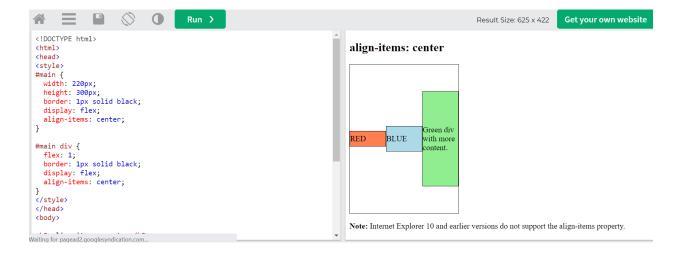

# align-items: center;

#### CSS align-items property

W3Schools offers free online tutorials, references and exercises in all the major languages of the web. Covering popular subjects like HTML, CSS, JavaScript, Python, SQL, Java, and many, many more.

Here we can also test display:flex. and justify-content: center;

Even delete the green div, other divs will also take all the space.

justify-content: center make words align horizontally.

Without flex:

#### align-items - CSS: Cascading Style Sheets | MDN

The CSS align-items property sets the align-self value on all direct children as a group. In Flexbox, it controls the alignment of items on the Cross Axis. In Grid Layout, it controls the alignment of items on

M https://developer.mozilla.org/en-US/docs/Web/CSS/align-items

### height: 100vh;

#### 100vh

height: 100vh = 100% of the viewport height

height: 100% = 100% of the parent's element height

That is why you need to add height: 100% on html and body, as they don't have a size by default

Something you have to know: if you use % for vertical margin or padding, % will be calculated on the **width** of the parent element, not the height.

#### Styling HTML and BODY selector to height: 100%; vs using 100vh

My brother and I were messing around in sublime earlier and he suddenly shout out, "I learned something new!"

https://stackoverflow.com/questions/27612931/styling-html-and-body-selector-to-height-100-vs-using-100vh

#### 100em

#### 1em is equal to the current font size.

2em means 2 times the size of the current font.

E.g., if an element is displayed with a font of 12 pt, then '2em' is 24 pt. The 'em' is a very useful unit in CSS, since it can adapt automatically to the font that the reader uses

#### 100px

### height - CSS: Cascading Style Sheets | MDN $\,$

The height CSS property specifies the height of an element. By default, the property defines the height of the content area. If boxsizing is set to border-box, however, it instead determines the height

#### 100%

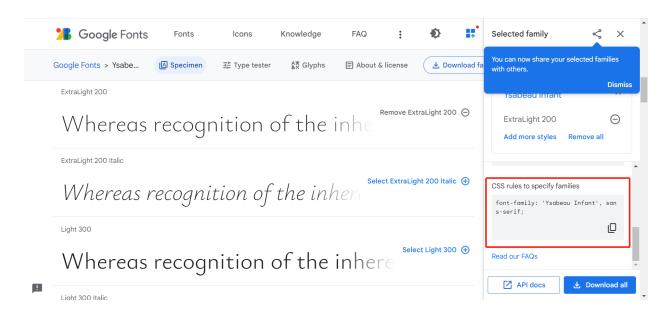

### font style

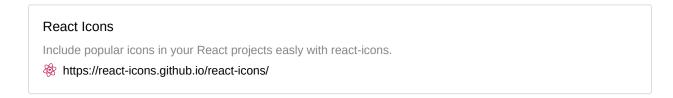

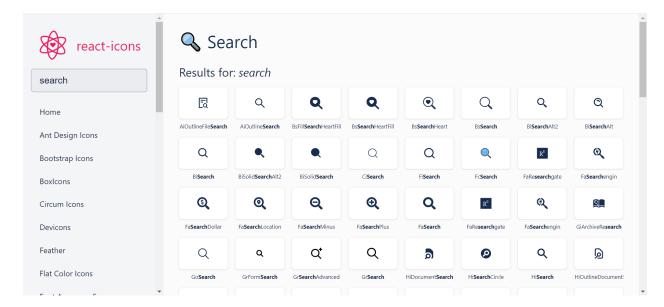

#### add†link to html

#### add↓font to css

### react Icons

search icons and pick what you like

# backgroud image

```
background-image: url("https://source.unsplash.com/1600x900/?nature,water");
background-image: url("https://source.unsplash.com/1600x900/?landscape");
```

Also, we can control parameters in css:

```
document.body.style.backgroundImage =
"url('https://source.unsplash.com/1600x900/?" + name + "')"
```
